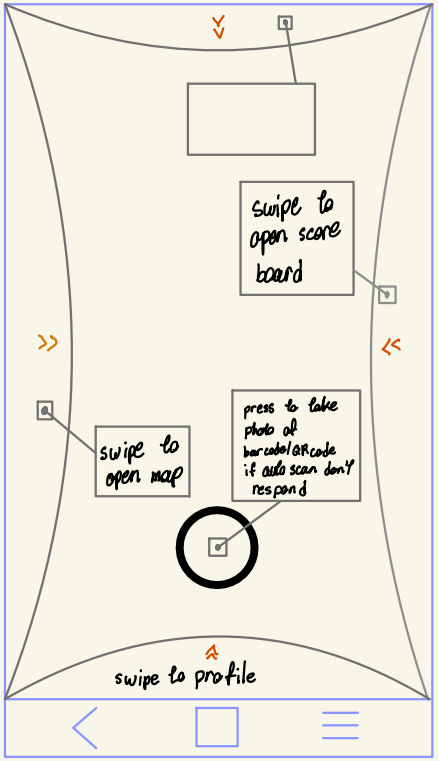
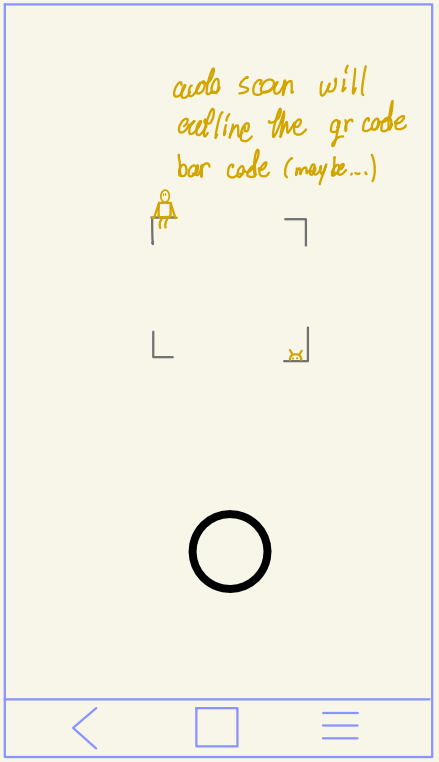
Activity:

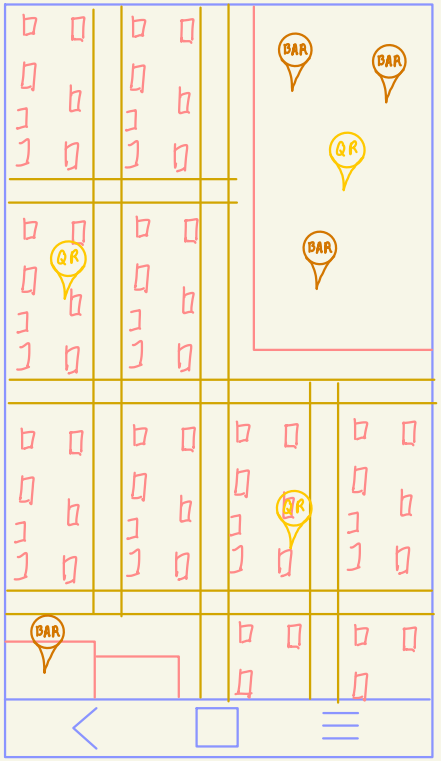
when first open app



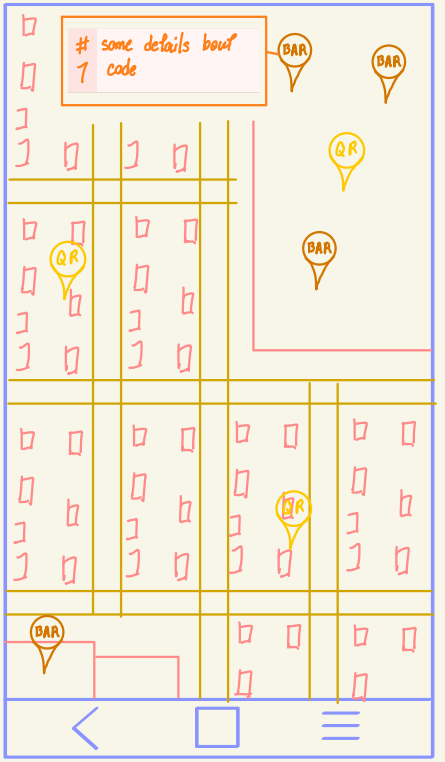
normal interface



map (something like google map with custom pointers?)



after click on a position



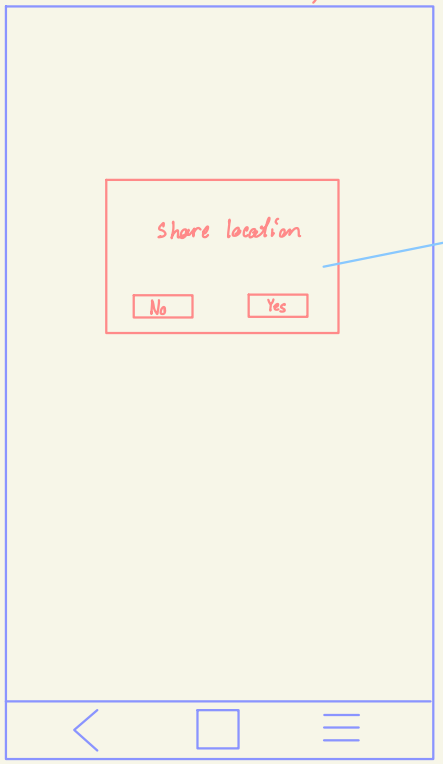
xml: Map

Activity:

xml: Add QR

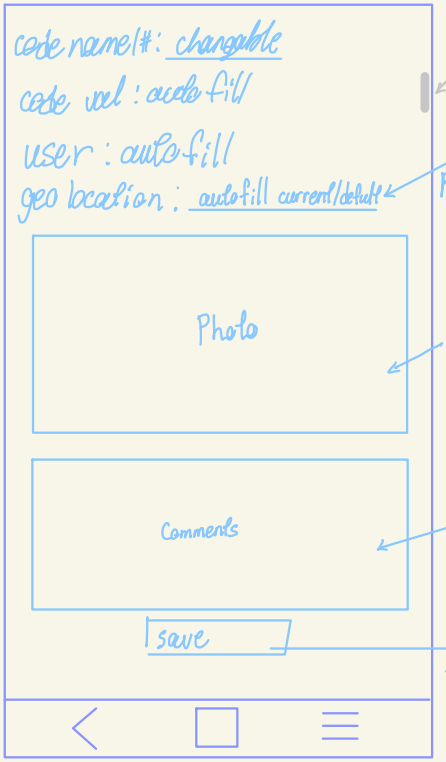
Activity:

Interface to store code
(pop up when first enter?)



if this displays first, could ask for geo permission here

Interface to store code



scroll bar

ask permission

(This is optional for the user)
Click to add photo of code which either takes the user to the camera or photo library (maybe?)
Note: Do we want to control the photo size? By that I mean that do we want to static the size of the display window or make the page scrollable and user can add their comments to the QR code future down the page?

Also optional for the user to add comment about where they found the QR/Bar code

send to data base
